

Lachenmeier Stretch Hood

Food Packaging

5-sided load protection

No crushing of products

No condensation issues

High speed wrapping -
250+ loads/hour

Optimum looks for
improved branding

Well known and
competitive solution

Low TCO

Trays

Lachenmeier Stretch Hood for Wrapping of Food Products

The alternative to traditional shrink and stretch wrap

No matter if food in cans, in bags, in boxes, in jars or buckets, we know exactly how to wrap food products in order to protect the load, Not only to provide the optimum stability, but also to prevent the product itself from being damaged by a film pressing with too much force against the load.

Lachenmeier Stretch Hood

One of the primary goals of end-of-line packaging is to ensure that products arrive at their destinations in the same condition as they left a production site. Whether products are transported by truck, train, ship or plane, it is essential that they do not shift, tilt, topple or otherwise create a safety hazard which could ultimately lead to damaging the products.

The flexibility and strength of stretch hood films combined with our knowledge of how to wrap food products, be it boxes, glasses, buckets, or bags has made stretch hood wrapping a cost efficient alternative to traditional stretch wrap and shrink wrap technologies.

Remove excess primary and secondary packaging material and save money on your total packaging costs

Controlled load containment force

The density and fragility of a product determines how much containment force our stretch hood film is allowed to exert on a product without damaging it. Combined with our know-ledge of how much compression force is needed to keep a certain load stable, we are able to choose the perfect film size, thickness and quality needed to obtain the required load stability at lowest possible price. No more no less.

Load shapes and wrapping patterns

Lachenmeier stretch hood is not just a closed film bag being applied to a uniform load. We can apply film sleeves as well as short hoods, we can wrap with perforated film to avoid condensation as well as apply film reinforcement on the load where needed. At the same time stretch hood is also for products with

different shapes and sizes where especially traditional stretch wrap tends to fall short, like loads with irregular shapes, single layer loads, loads with sharp edges or protrusions as well as in-bound loads. You name it, we wrap it.

Lantmännen

Flour and cereals in paper bags stacked in trays or 25 kg bags of flour products on pallets ranging from 1/4, over 1/2 to full euro pallets are running through the Lachenmeier stretch hooder type Multi FleXI at Lantmännen. The 1/4 pallets are wrapped individually, then restacked 4 on a euro pallet for final wrapping. Take a look at the packaging setup at Lantmännen...

Develey

A huge variation of food products in jars placed in carton trays as well as miscellaneous products in plastic buckets are what characterises the production line at Develey. Optimum branding of the various products are guaranteed due to the transparent film, and condensation issues are eliminated as the pallets are wrapped with a perforated film. Take a look..!

Arla

Wrapping of beverages in tetra bricks are considered a difficult task, but knowing how to apply a film in order to avoid product crushing and at the same time obtain the required load stability is what makes Lachenmeier Stretch Hood the solutions for this product group. See for yourself...!

DMK

Food products also come in bags, like shown on the video above. Milk powder in paper bags is very suitable for stretch hood wrapping. The transparent film not only keeps the products in pristine conditions but also guarantees the required containment force necessary for heavy bag loads. See wrapping of bags - the most common product to be wrapped using the stretch hood technology...
